What is Figma Prototype?

- ❖ Figma prototype allows you to create interactive flows that explore how a user may interact with your designs. Prototypes are an excellent way to preview interactions and user flows and share and iterate on ideas.
- ❖ What is a prototype in general?
 - A prototype is a simulation or sample version of a final product, which UX teams use for testing before launch. With a prototype, the goal is to test and validate ideas before sharing them with stakeholders and eventually pass the final designs to engineering teams for development.
- ❖ Prototypes are essential for solving and identifying user pain points with participants during usability testing. Testing prototypes with end-users enables UX teams to visualize and optimize the user experience during the design process.
- ❖ How do we use Figma Prototype in Design?
 - Figma is a powerful web-based design tool that helps you create anything, websites, applications, logos, and much more. You'll take your first steps into User Interface Design and User Experience Design by learning how to use Figma.
- ❖ You can use it to do all kinds of graphic design work, from wireframing websites, designing mobile app interfaces, prototyping designs, crafting social media posts, and everything in between.
- ❖ Learning graphic design in Figma will save you time and stress. When you work with this software, it makes the design process quick, fun, and very efficient. You can collaborate online with other people very quickly.

What is Figma Prototype?

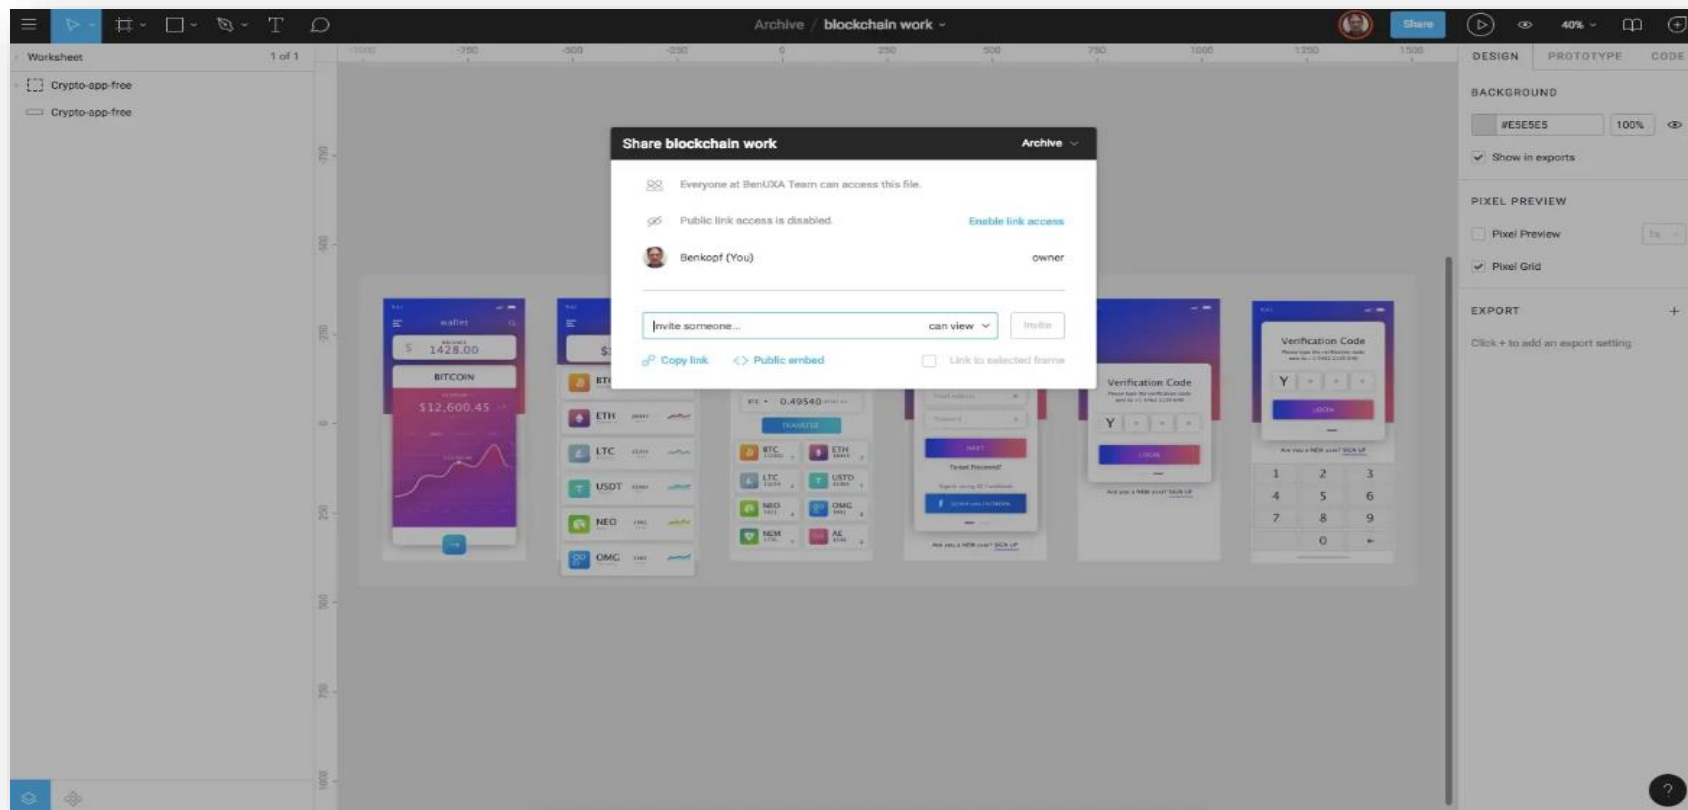

- ❖ Collaboration in Figma Is Simple and Familiar
- ❖ Because Figma is browser-based, all teams can collaborate as they would in Google Docs. When people use Figma, they show up in the corner, and you can click on them to see what they are doing. Each person has an icon to click on.

❖ Figma Sharing Is very Flexible:

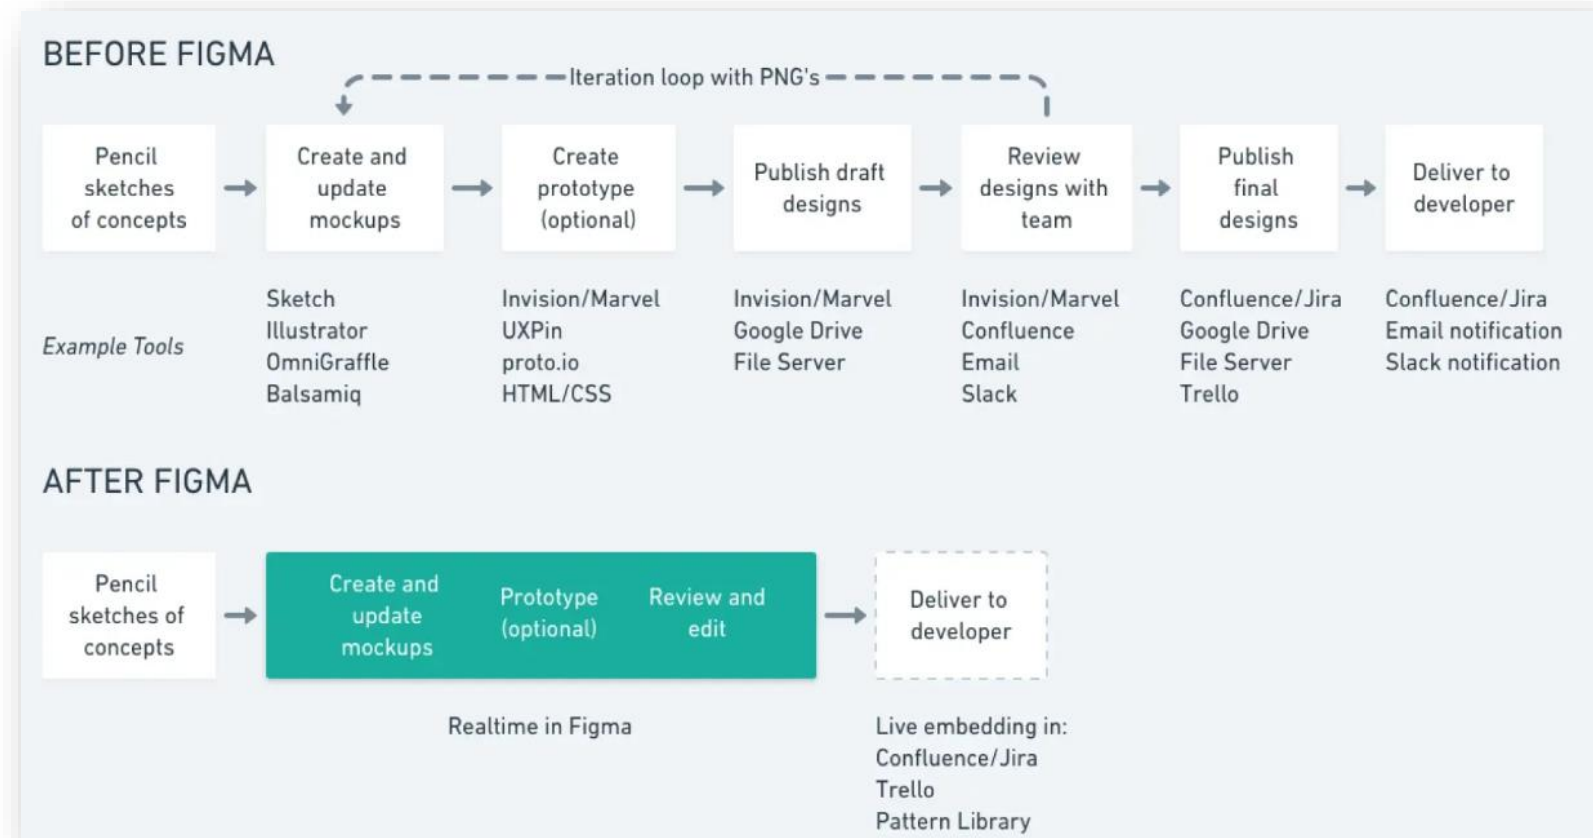

- Figma allows permission-based sharing of any file, page, or frame (called an artboard in other design tools). When a share link is created to a frame on a page, the person clicking on that link will open a browser version of Figma, and a zoomed-in view of the frame is then loaded to the browser.

❖ Embedded Figma Files with Real-time Updating.

- Figma also shares live embed code snippets to paste an iFrame in third-party tools.
- If a change is made to the mockup by anyone in Figma, the change will be seen live by everyone else involved.
- **In the following diagram it shows the before and after Figma:**
